

USE CASE · ONEDASH AUTOMATIONS

Let the AI Agent make the Call

Outreach becomes an automation, not a staffing decision
— the agent dials, talks, transfers, books.

Clinical specialists spend over half their day cold calling — and most of it ends in a voicemail, a ring-out, or a bad number, while high-needs members wait for the time that's left. OneDash puts an AI voice agent on the same queue, working the same protocol.

✓ 18k real AI calls placed to a live Medicare population over 6 months

Dials the cohort in parallel

Every eligible member is attempted in week one, not quarter one.

Interventions land while the gap is still closable.

Works every attempt equally

The 7th attempt gets the effort of the 1st; the hard-to-reach segment stops being written off.

Deep-attempt outreach becomes economical.

Warm-transfers to staff

A specialist joins only when the member is ready to act.

Clinical time shifts from dialing to intervening.

Schedules on the line

Books your telehealth partner's calendar* while the member's intent still exists.

Adherence measures move without new FTEs.

Speaks the member's language

Hears the member's language and keeps going — the interpreter leg and its per-minute bill disappear.

Language stops being a gap-closure ceiling.

Documents every call

Attempt, disposition and reason, coded identically every time.

Audit-readiness as a byproduct, not a project.
